

## Global pull request search, labels and more with Organizr

3 Simple ways to stay on top of everything in Bitbucket

We have a common problem - too many pull requests and too many repositories and projects all at the same time! Organizr allows you to easily filter and list all pull requests across the entire Bitbucket instance.

### 1 Filter Pull Requests across the entire instance

Break the chains of viewing Pull Request lists only inside repositories.

Organizr filters and lists all Pull Requests across the entire Bitbucket instance.

Filter by due date, label(s), author, reviewer, state, text

### 2 Pull request labels and due-dates to focus and prioritize

Add metadata like due-dates and labels to individual Pull Requests to categorize and prioritize your daily work.

Pull request overwhelm ends here.

### 3 Create structured pull request merge dependencies

Ensure pull requests are merged in order of priority.

Structure the sequence in which multiple pull requests should be merged.
