

Helping teams stay connected and work moving forward

Slack is the channel-based messaging platform that connects teams across an organization, bringing the right information together with the right people at the right time. Together, Slack and Atlassian are simplifying the effort it takes to keep teams aligned, coordinated and productive by offering integrations across a wide range of Atlassian products, including Jira Cloud, Jira Server, Trello, Bitbucket, Confluence Cloud, ConfluenceServer and OpsGenie.

Jira

With the Jira Cloud and Jira Server integrations, teams can manage Jira projects within Slack.

- Control rich notifications. Keep everyone in sync by funneling updates on tasks, stories and requests into your Slack channels. Filter notifications that matter most to you.
- Stay on top of issues with Jira Cloud. Get contextual previews of tickets when they are mentioned, and action them directly from within Slack. You can even create issues directly from Slack messages themselves.

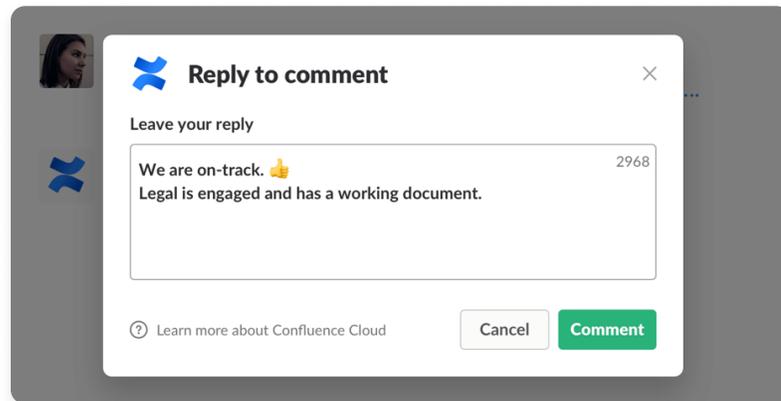

The screenshot shows a Slack message from the 'Jira Cloud' app, timestamped '9:10 AM'. The message content is a form for creating a Jira issue. The title of the message is 'Create Jira issue'. The main text of the message is 'Large list of channels causes front end view to break', with an 'Edit' button to its right. Below this is a preview of the issue description: 'Whenever a workspace has over a thousand channels, the channel picker is breaking the javascript. Maybe we can fix this with pagination.' There are two dropdown menus: 'Jira project' set to 'Front End (FE)' and 'Issue type' set to 'Bug'. At the bottom of the form are 'Create' and 'Cancel' buttons. A mouse cursor is hovering over the 'Create' button.

Confluence

The Confluence Cloud and Confluence Server apps for Slack provide one dedicated place to stay up to date on what's happening, directly within Slack.

- Ensure that team interactions are productive. Customize and receive actionable notifications for changes across spaces, pages, blogs and more.

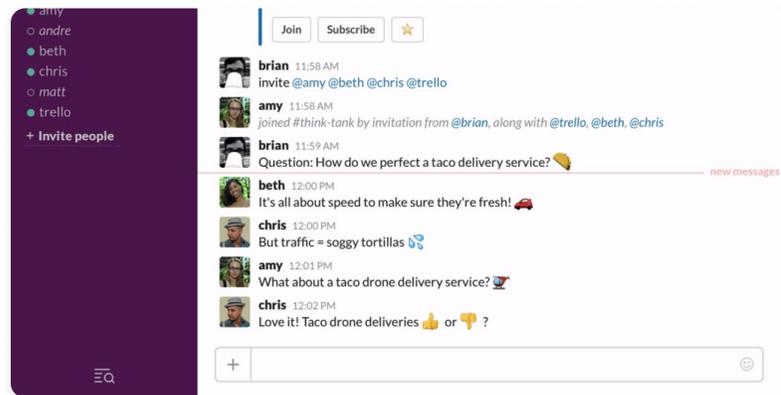

- Quickly move work forward in Confluence Cloud. Take action on content, such as replying to a comment or liking a page, and preview Confluence details without ever leaving Slack.

Trello

Link Trello and Slack to enhance productivity by creating a seamless and collaborative workflow between the two apps.

- Eliminate context-switching. Add new Trello cards to boards, change due dates, attach conversations, join cards and boards, and more directly from Slack.
- Easily surface insights. Paste a Trello link into a Slack channel to automatically display key insights like card members, descriptions and comments.

Ops Genie

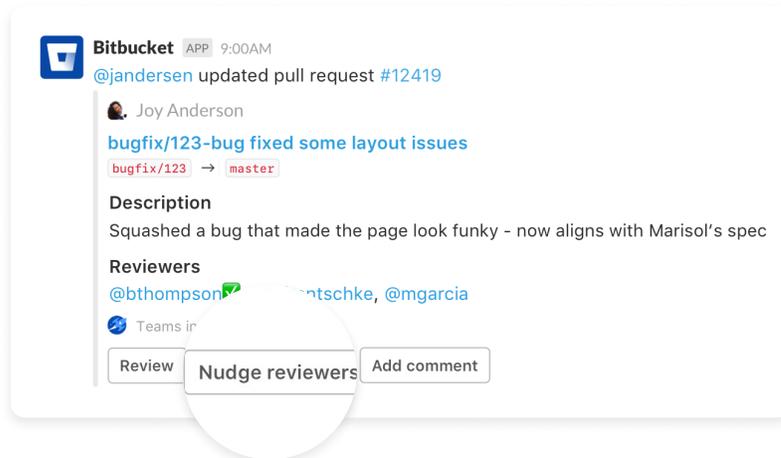

Never miss a critical alert, by ensuring that the right people are notified within Slack.

- Manage and track the progress of alerts. Tailor when and how alerts show up in your channel, and forward them to the right people.

Bitbucket

With the Bitbucket Cloud bot for Slack, your team can get contextual information about your code repositories and take action without leaving your Slack channel.

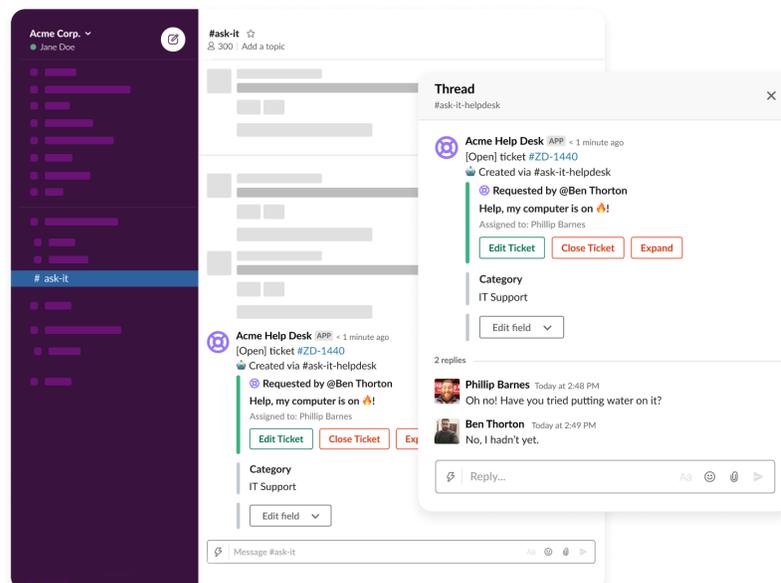

- Keep teamwork moving. Send friendly nudges to teammates about overdue pull requests.
- Easily share code. Share code examples with inline code snippets.

Halp

Halp is a Slack-based help desk for IT support, finance, legal, and other operations teams to better manage requests. With Halp you can:

- **Use an emoji to turn messages into a ticket** from channels or DMs. The comments sync with messages in the thread. Users can also submit request forms from Slack and create tickets using App Home or Slash commands.
- **Triage tickets** from Slack, or manage your tickets from the Halp web app. If you've already got a ticketing system, Halp has native two-way integrations with Jira Service Desk and Zendesk.
- **Automatically answer common questions** using Halp Answers. Create Answers from Slack messages or Confluence articles, and Halp will automatically recommend those answers on relevant tickets.
